Deep Debug Analysis - Create Entry Still Not Working

Current Situation

The user has applied the fixes but the "Create Entry" button is still not clickable/functional.

Potential Issues Not Yet Addressed

1. Missing Required Fields

Looking at the screenshot, I can see:

- Estimated Hours: 0
- Actual Hours: 0
- Description: filled
- Challenges Faced: filled
- Key Learnings: filled

But I don't see:

- **Title** - This is a required field and might be missing
- **Start Date** - This is a required field and might be missing
- **Work Type** - Might not be selected

2. Form Validation Schema Issues

The `insertWorkEntrySchema` might be too strict or have validation rules that are preventing submission.

3. React Hook Form State Issues

The form might not be properly initialized or the validation state might be preventing submission.

4. Button Disabled State

The button might be disabled due to:

- Form validation state
- Missing required fields

- Mutation pending state
- Form not being dirty

Next Steps to Debug

1. Check if all required fields are filled
2. Examine the validation schema more carefully
3. Add more debugging to see what's preventing submission
4. Check if the button is actually disabled or if the click handler isn't attached

Most Likely Issue

Based on the screenshot, it appears the **Title** and **Start Date** fields are not visible or not filled, which are required fields that would prevent form submission.
